

ARROWLEAF CLOVER

ANNUAL CLOVER

Arrowleaf Clover is an upright, cool-season, reseeding annual legume that grows to a height of 3-4 feet tall under good conditions. Seeds germinate in the fall, but grow slowly during the winter. **Arrowleaf Clover** is suitable for hay, grazing, seed production, soil improvement, and wildlife. Deer and turkey readily feed on this clover, which often persists well into early summer. This clover is suited to a wide range of soil conditions from well – to moderately well – drained and from slightly acid to slightly alkaline. It is not suited to light textured, droughty soil of low fertility or to poorly drained, wet soils.

PLANTING TIPS

- ◆ Prepare a smooth, clean seedbed
- ◆ Firm with a cultipacker before and after planting
- ◆ Cover seed ¼ to ½ inch deep
- ◆ May be planted in an established summer perennial grass sod by light disking or with a no-till drill
- ◆ Interseeding into a grass sod should be delayed until about the first frost date
